

SYMMETRY™ GLOBAL

Symmetry Global is the ideal choice for organizations spread over a number of geographically dispersed sites. It allows each site to maintain autonomous operation and responsibility for its own security systems, while obtaining benefits from centralized administration, card management and alarm handling.

Symmetry Global not only provides a multi-site organization with the improved efficiency of central card management, but also provides the ideal solution when people require access to more than one site, since one operation can add cards to all the required locations.

Symmetry Global centralized administration is achieved by a Global Client, which can connect to any site and log on as if it were a local client of that site. This gives true remote management, allowing full access (dependent upon operator permissions) to history reporting, card administration and control of readers, doors and monitor points.

Optionally, each site can communicate alarms to a Global Client for central alarm management (e.g. during out-of-office times), which can enhance security and improve efficiency.

The Symmetry Global architecture provides the ultimate resilience for multi-site applications, since any failure of the corporate network still allows autonomous regional systems to continue full operation at a local level.

KEY FEATURES

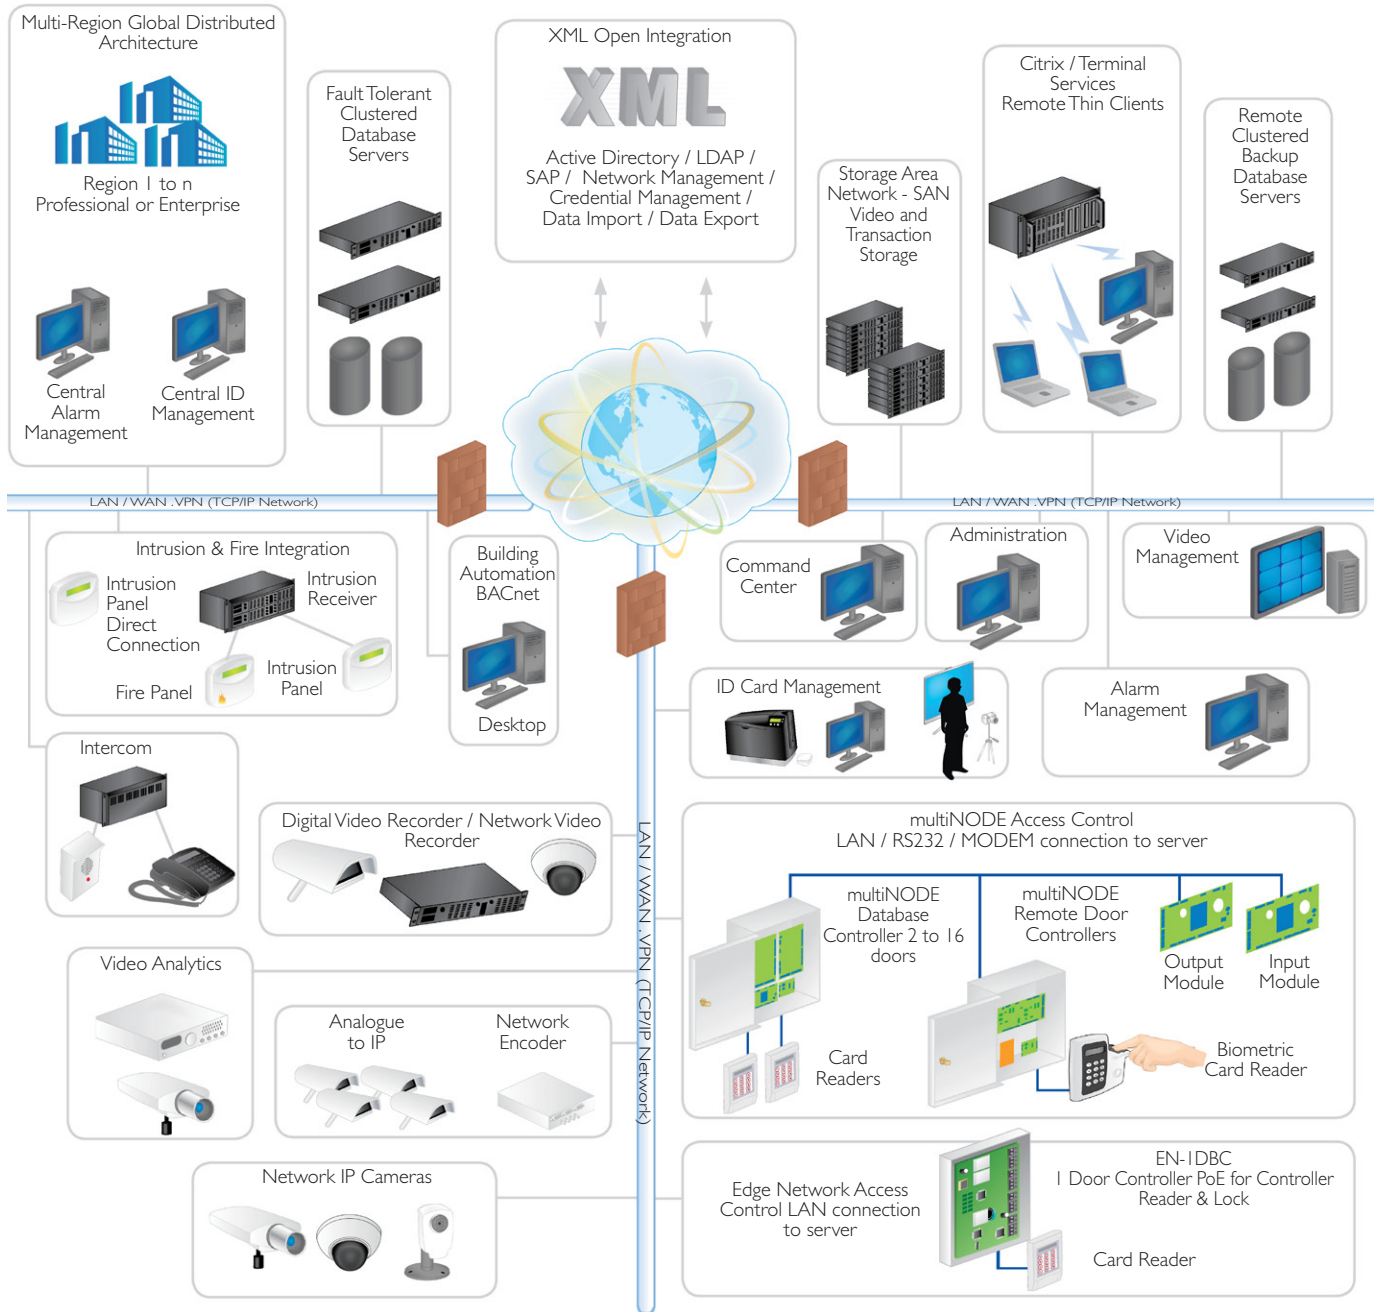

- Scalable security solution for very large or global network applications
- Unrestricted number of clients, readers and card holders
- Cost effective control of security across the organization
- Uses the high-performance Microsoft® SQL Server database system
- Each site (including head office) has control of its own security systems
- Provides integration of regional systems, each with its own database
- Centralized and synchronized card production and administration
- Global Clients for remote access to any site
- Centralized alarm handling if required
- Wide range of optional software modules

OPTIONAL MANAGEMENT SOFTWARE

Software packages offer a range of fully-integrated additional features designed to enhance the system and provide higher levels of flexibility and integration. Optional features include:

- Symmetry Video Management
- Threat Level Manager
- Intrusion Interface Module
- Web Access
- XML Open Integration Module
- Building Control Module
- Intercom Management
- Directory Sync Manager
- Guard Patrol Management
- Muster Management (Safety Roll Call)
- Data Connect Import/Export
